CRYSTAL-VIOLET VACCINE AGAINST HOG CHOLERA

Prof. S. N. Vyshelesskiy

As far as the fight against hog cholera is concerned, the veterinary physician I. I. Kulesko (Ukrainian Institute of Experimental Veterinary Medicine) proposed a new method involving use of the so-called crystal-violet vaccine. By treating the virulent blood of hogs suffering from cholera with crystal violet, this investigator obtained a vaccine which protects hogs from cholera.

Innoculations with crystal-violet vaccine should be carried out in threatened locations, but not in places where hog cholers actually develops. The results obtained by using Kulesko's vaccine were entirely satisfactory with the exception of individual instances of failure when the vaccine was applied at fresh foci of hog cholera.
